Microsoft Defender Was Wrongly Detecting Malware in Larnet Monitor

2024-01-17 - Kacper Dylewski - [Comments \(0\)](#) - [Lasernet News](#)

Between December 2023 and Q2 2024, Microsoft Defender was flagging the **LnMonitor.exe** software (Larnet Monitor from Formpipe) as Trojan:Win32/Znyonm!pz or Phonzy malware. However, Microsoft confirmed that this was a "false positive" and that the Larnet software was clean.

From Q3 2024 onwards, Formpipe can confirm that Microsoft Defender's virus definitions have been updated. As a result, this issue is now resolved for customers and for Formpipe.

For Users of Previously Affected Larnet Versions (10.6 and Earlier)

If the latest Microsoft Defender definition files are installed, Microsoft Defender will no longer flag Larnet as malware and will not quarantine **LNMonitor.exe**.

The workaround of using the web version of Larnet Monitor is no longer necessary.

For Users of Larnet 10.7 and Later

Formpipe released Larnet 10.7 in February 2024. This version and later versions of Larnet do not include the third-party components that were triggering the false-positive detection. Customers that do not require the functionality provided by the removed **Performance** and **Transactions** tabs in Larnet Monitor can continue to use these Larnet versions.

For Formpipe

The Microsoft build servers that Formpipe uses to build new versions of Larnet run Microsoft Defender. These build servers no longer flag Larnet builds as malware and can successfully build new versions of Larnet.
